【Ⅵ】 次の英文を読み、27 ～ 33 の問いに対する答えとして最も適切なものを a)～d)の中から一つずつ選び、その記号を解答用紙に記入しなさい。

Coral reefs are like cities under the sea where many ocean creatures live. They are built by tiny animals called coral polyps*, which create hard skeletons** from minerals in the ocean. These skeletons form the structure of the reef, providing homes and hiding places for a huge amount of sea life, including colorful fish, sea turtles, and even sharks.

These reefs are found in warm, clear waters around the world, mostly in warmer and hotter regions. They provide a home for a wide variety of different plants and animals. This makes them important not only for the life that lives there, but also for people who depend on that life for food, money from tourism, and protection against storms.

However, coral reefs now face many serious problems. One of the biggest challenges is climate change, which causes ocean temperatures to rise. When the water gets too warm, corals push out the algae*** living in their bodies, which turns them white. This is a process known as coral bleaching****. If the water stays too warm for too long, the corals can die.

Pollution from development, farming, and wastewater are all threats to coral reefs as well. Chemicals and excess nutrients in the water can cause algae to grow, which covers the corals and prevents sunlight from reaching them, this harms their growth and survival.

Fishing is another issue that affects coral reefs. Removing too many fish changes the balance of life on the reef. Some fish help control algae growth by eating it, while others clean the reef by feeding on dead corals and keeping other corals healthy. Fishing nets can also damage it as they are dragged over the reef.

Protecting coral reefs is important if they are to survive and it helps keeps the ocean healthy. Recently protected areas have been created where fishing and other harmful activities are not allowed. Pollution from the land is being reduced, and people have begun to fish more carefully.

Teaching people, especially students, about the importance of coral reefs can lead to more protection. Understanding how they work, why they are necessary for life in the ocean, and the problems they face, helps make sure they will continue to survive.

Coral reefs are valuable natural systems that support marine life and provide benefits to humans. The more we know about how to protect and support coral reefs the better we will be able to preserve these delicate but important natural cities for the future.

*coral polyps = サンゴポリプ (サンゴ表面部分の突起)

**skeletons = サンゴをつくる石灰質の骨格

***algae = 藻類 (alga) の複数形

****coral bleaching = サンゴ白化現象
